FILEEXTINGUISHER

Completely Delete What You Really Want to Delete...When a fire is put out, it is very important to make sure that the fire is completely out. Embers left behind can flare up and the damage can begin anew. When you put out a fire, you want the fire totally extinguished.

This is the same idea behind FILExtinguisher™. Typically, data deleted on the computer is not truly deleted. The file stays on the disk until it is overwritten by another file. Until then, those files or file fragments can be recovered. If the data is sensitive, the recovered data could be exploited, causing damage much like the missed ember in a fire. When you delete your data, you want the data totally extinguished. (for Windows® 98/Me/2000/XP)

What are our customers saying...

ZDNet *HELP & HOW-TO*

Help! I just deleted a folder of important tax stuff by accident!
How do I retrieve it?

ZDTV

Accidental deleting happens, but it's not always cause for mourning. Often, the data is recoverable fairly easily.

First, check the trash. If you haven't emptied your recycle bin you can probably recover it by dragging it out of the trash & onto your desktop. If you have emptied your recycle bin, you'll

have to use a file recovery program such as **FILERECOVERY® Professional**. It can recover damaged or deleted files. It works with Windows 95/98/Me/NT/2000/XP.

PHOTORECOVERY® for Digital Media

Software rescues photos on corrupt card
09/05/2002

By **JIM ROSSMAN** / The Dallas Morning News

Question: I need some serious help. I just returned from an extended vacation, and I took lots of pictures with my digital camera. I was downloading the photos to my computer when I returned home, but one of the cards locks up my computer each time I try to move any images to the PC. Is there anything I can do to retrieve the images or have I lost more than 100 of my precious vacation photos?

E.R., Wylie

Answer: A program called PhotoRecovery for Digital Media from LC Technology is designed to save image files from damages

or corrupt memory cards. You simply insert your damaged media into the reader on your PC or mount the card through the camera's cable and launch PHOTORECOVERY. A list of photos on the card will be displayed for you to copy safely to your hard drive. LC Technology says it can recover photos from most memory cards even if the cards have been reformatted.

You can download a demo version of the program at www.LC-Tech.com. If you like what you see, you can pay \$40 for the unrestricted version.
